DETAILED ACTION

Supplemental Examiner's Amendment

Applicant is advised that the **Notice of Allowance** mailed on **17 October 2007** is amended to correct the typing error of claim 42 as presented in the following Office action.

Authorization for this Examiner's Amendment was given in a telephone interview with Jordan M. Becker (Reg. No. 39,602) on 30 November 2007 that **one of the duplicated claim elements of claim 42 that has been allowed in "Notice of Allowability" filed on 10/17/2007 needs to be deleted.**

This application has been amended as follows:

IN THE CLAIMS

Cancel claim 1 – 34 and 37 – 41.

Replace claim 42 as follows.

Claim 42

A machine-readable storage medium storing instructions which, when executed by a processor in a network cache, cause the network cache to perform a process that comprises:

receiving at the network cache, from an operator, a first user input specifying a user ID, the user ID representing an identify of a user who is to be authenticated by the network cache during a subsequent authentication;

in response to the first user input, identifying one or more objects that contain the user ID in an authentication database associated with an authentication server;

causing information identifying each said object that contains the user ID to be output to the operator;

receiving at the network cache a second user input from the operator, indicating a selection by the operator of an object of said one or more objects, said object containing a plurality of attributes and a separate attribute name for each of the attributes;

in response to the second user input, causing the attributes in the object and the names of the attributes to be output to the operator;

~~receiving at the network cache a third user input from the operator, specifying a name of an attribute which contains the user ID in the object~~

receiving at the network cache a third user input from the operator, specifying a name of an attribute which contains the user ID in the object; and

storing, in a configuration database of the network cache, the name of the said attribute which contains the user ID, for use by the network cache during subsequent authentication.

Allowable Subject Matter

1. Claims 35, 36 and 42 – 45 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Applicant has claimed unique features in the instant invention which are not found in the prior art, either singularly or in combination.

According to the invention, a method for configuring a network cache to communicate with an authentication server comprises receiving at the network cache, from an operator including receiving at the network cache, from the operator, a first user input specifying a user ID, the user ID representing an identify of a user who is to be authenticated by the network cache during a subsequent authentication; in response to the first user input, identifying one or more objects that contain the user ID in an authentication database associated with an authentication server; causing information identifying each said object that contains the user ID to be output to the operator; receiving at the network cache a second user input from the operator, indicating a selection by the operator of an object of said one or more objects, said object containing a plurality of attributes and a separate attribute name for each of the attributes; in response to the second user input, causing the attributes in the object and the names of the attributes to be output to the operator; receiving at the network cache a third user input from the operator, specifying a name of an attribute which contains the user ID in the object; and storing, in a configuration database of the network cache, the name of the attribute which contains the user ID, for use by the network cache during subsequent authentication.
